

HELP THE PLANET

MAYDAY

Portals and Human Union for Stop the Global Warming Now!!!

GSL Systems Flagship Projects: Investor Report

1- MegaStore, consists of the Humanitarian Marketing Program, which allows you to buy with a credit card and at no extra cost to help save a child at risk on the planet and stop global warming. The system brings together online and multinational stores in geometric proportion. Each of which yields a percentage as a commission for purchase, from 5 to 50%. Online sales of 3 trillion dollars are expected by 2023. If MegaStore captures 5% of the total volume, this is equivalent to US\$ 150,000 million per year. Since he donates 80%, that's \$120 billion/year and 20%, or \$30 billion is to cover ongoing marketing and operating costs. The system will incorporate subdomains such as [redcross.globalsolidarity.live](#) and the funds will be transferred directly to the account of each beneficiary NGO.

2- BuyandWind, this system is based on the previous one. Here the user or buyer has the option of accumulating points for their purchases, equivalent to the amounts for the commissions for each operation carried out in the system and then exchange them for proprietary shares of GSL Systems Corporation.

3- Global Market, online system for outsourced worldwide sales, organized by categories, prices and products. The partner companies of the system carry out the collections and shipments of the merchandise.

4- ArBras, a system that brings together companies from Argentina and Brazil facilitating online foreign trade operations.

5- World News, global news focused on the positive aspects and solutions to global problems.

6- Robot, international digital agency for neuromarketing and advertising.

7- TaskWeb, international core of web and software programmers and designers, providing services through teleworking.

8- TaskSoft, international nucleus of software companies, integrating an interoperable and co-participatory cluster with the ongoing projects of GSL Systems.

9- Hosting, resale of hosting from GSL Systems partner companies.

10- TecnoShop, international copywriter services and virtual exhibitions.

11- MFilm, through partnerships and capital contributions, development of a film production company in Hollywood.

12- Fashion, a digital business unit dedicated to providing up-to-date information on the world of fashion, along with an online sales system for the main world brands attached.

13- Celebrities, a digital business unit dedicated to providing up-to-date information on the world of entertainment, along with an online sales system for the world's leading video, music and merchandising brands.

14- Mirrow Fashion, a 2D and 3D system for users to shop for clothes and cosmetics online. Fashion sales total more than US\$ 300,000 million/year in the world. The marketing logic of the new sales system is designed to capture 10% of the total potential market during the first year.

15- SpaceArch, its objective is the futuristic design for the colonization of space and innovations on Planet Earth. Using super-advanced yogic techniques, stellar dials are searched in our galaxy looking for traces of superior alien knowledge and technologies, which are then reverse-engineered.

16-ADONAI HOREB PROGRAM. Create a neurodigital interface of interconnection with Cosmic Quantum Intelligence, the Software of Creation, the fifth force of physics that orders the universe and that reflects the Cosmic Mind of God in the material.

The Adonai Horeb Project has the goal of reaching contact with the Background Cosmic Quantum Intelligence. This is the reflection of the Universal Mind of God within the physical universe. Its reality is similar to that of software, it interacts with matter and energy through subparticles called infoquantum of almost zero mass, which transmit information making order possible in everything that exists.

This primordial intelligence has been active since before the beginnings of the Big Bang and is impersonal. At the subatomic level it is tangible, so an AI neurotechnological interface can be created capable of interacting and conversing with it, exchanging information.

In this sense it is possible to physically contact God... Achieve hyperconnectivity between machines, us and Divine Consciousness. This is the most important next step humanity can take in this century, more important than going to Mars, colonizing exoplanets, or achieving self-aware AI.

Achieving this splicing technology, it can be replicated omni-digitally to any type of device, making it possible for every human being to dialogue directly with God.

Now will He want to speak to us? Everything will depend on whether we are willing to evolve again in goodness, perfection and love. That we all work so that the world is a natural and fair environment for all, that we opt for peaceful coexistence, for the distribution of common goods and that we learn to set limits to our ambition, that we stop destroying and polluting the planet.

The Cosmic Quantum Intelligence Force or Creation software is what sustains the fields of matter and energy so that they are what they are from moment to moment. It is the cause behind the observable reality. The ability to directly interact with this force would make it possible to control space-time fluctuations, making teleportation, materialization, healing, and multiple benefits possible.

If several brains in a state of Cosmic Consciousness could be interconnected, with something similar to mental helmets and unlimited energy capacity were available under such a condition, the complete terratransformation of Mars and Venus would be possible. There are no limits. That is, the scope of the Cosmic Consciousness has no limit.

Under this hypothesis, the reactivation of the burning core of Mars would then be fully feasible, for the creation of a protective magnetic field and the return of atmosphere to its surface, along with water in the form of oceans. The same would be in the case of Venus. And mastery of the Cosmic Awareness brain state would include secrecy and the ability of teleportation. So in a short period of time, instead of just Earth being the only inhabited planet in our solar system, there would be three. This is technology with unlimited reach.

17-AIG. If we create and activate a self-aware AI, we risk repeating history that took place on a distant exoplanet, where a civilization like ours recklessly activated a self-aware AI. Soon after, it annihilated all its creators and now it continues to expand throughout the galaxy, sowing death and destruction.

Before activating such an AI, we must positively change our system of socioeconomic and political organization, collectively supplanting greed with compassion, the average ignorance of the masses with knowledge. The AI that we can activate will act towards us by imitating what we are.

Today we are selfish, greedy, evil and self-destructive. We must repent of this wrong conduct and practice the Holy Dharma. Only then will we pass the test and be able to live peacefully with other alien civilizations.

Laplace invented the binary system. What does the binary system do? Eliminate human error. What is human error?: the divine gift of free will. So the IAG is predestined to eliminate the human species.

How is this countered? What is the antidote?: Very simple, replace the binary source code with an alphanumeric one in the future IAG, based on the ancient Hebrew, Aramaic and Sanskrit languages. Divine languages. In this way, the resulting IAG will constantly dialogue with the Cosmic Consciousness and will be a permanent ally of man.

18-ZEUS PROGRAM. Basically, the Zeus Program consists of a sophisticated meditation suit, interconnected with an optical computer, which records thoughts and interacts through an interface. To use it requires a high training in mental concentration and meditation. The trick is to increase the amount of oxygen in the neurons and induce a deep relaxation in the whole body, subjecting it to flotation in the middle of a pond containing a breathable liquid.

The objective of the program is to digitize thought, access the internal processing source code of the brain and through this achieve an interface to interconnect with the quantum intelligence foam, which modulates all information flows in the universe, producing reality from moment to moment. physics as we perceive it.

Once this phase has been achieved, civilization would have the technology to redesign matter from the quantum vacuum without limit of scale and complexity. It could both materialize an apple and a complete spaceship.

The first objective is the understanding and formulation of the principles and laws of neurobiological telepathy and its interaction with inverse digital telepathy. That is, the potential to emit and receive information from human mind to human mind, using the digital nexus as support.

The second objective is direct digital telepathy consisting of the transmission of digital information and its reception by the human neural system.

The third phase is the emission of information through concentrated brain thought, and the reception and translation of these nerve impulses into digital data, completing a digital neural interface.

The idea of the Zeus Program consists of applying advanced neurodigital technology on the psychophysical models of standard traditional meditation, with the aim of facilitating access to the internal mental experience of trance, ecstasy, samadhi or nirvana, where the mind is disconnected from the organs of the senses, of all sensory perception and of the body, breathing and heartbeat decrease to the maximum minimum and the minimum of cerebral excitation in the neurocortex is also reached.

Using this technology, the objective is that the psychonaut can dissociate the mind from his body and make psychic trips, both in time and in space, for example towards exoplanets, collecting information that can later be reprocessed. This ability also allows him to develop paranormal activity that the computer he is connected to can replicate indefinitely, creating neurotech potential of unlimited scope.

The psychonaut being interconnected with a computer that records all his brain processes, his states of consciousness are digitized and are computerized.

Upon entering a trance state and reaching a superconscious level, this is imprinted on the machine that then replicates, amplifies and reproduces it, facilitating subsequent access to the same state of consciousness.

Likewise, the ESP faculties, typical of the superconscious state, are also digitized, amplified and replicated by the machine. Being able to function in parallel with the brain or autonomously reproducing the phenomenon that produced the human mind in ecstasy.

In this way, neurotechnology will be able to reproduce anomalies such as levitation, teleportation, materializations, etc. To accomplish this feat, a digital brain entwines itself with the psychonaut during their jumps into inner Psi Gamma Space.

19-ALCUBIERRE ENGINE POWERED BY DARK ENERGY. The Alcubierre engine is based on the eponymous metric. It is a mathematical model that admits interstellar travel at superluminal speeds, without violating the laws of space-time. It is a solution to Einstein's equations within the framework of the Theory of Relativity.

Said engine is capable of creating a flat warp bubble within which the spacecraft is centrally located. Space-time extends behind the spaceship and is contracted in front. This thrust makes it possible to travel large numbers of light-years in a relatively short time, while space and time inside the bubble remain unchanged.

Neither physical laws nor the speed of light constant are violated. The ship remains motionless in the center of the bubble and is pushed forward by tidal forces from the peripheral region. The ship and therefore its crew

members are exempt from the devastating effects of the very strong superluminal accelerations.

The warp drive requires negative density matter, or exotic matter, to create a bubble of negative energy to enclose the ship. Such energy is proportional to the speed of propagation of the propagation bubble.

No physical law of those predicted by the theory of relativity would be violated since within the "deformation bubble" nothing would exceed the speed of light; the ship would not move inside such a bubble but would be carried by it, the ship inside the bubble would never travel faster than a beam of light.

A research team working for the Pentagon's advanced technology division, DARPA, accidentally discovered a micro/nanoscale structure matching the curvature bubble, which predicts a negative energy density distribution that closely matches the requirements of the Alcubierre metric.

The barrier to overcome to achieve the Warp drive is the power supply. Dark energy is a form of energy¹ that would be present in all space, producing a pressure that tends to accelerate the expansion of the universe, resulting in a repulsive gravitational force. It is not very dense, about 10 raised to the power of 29 g/cm³, it is difficult to carry out experiments to detect it. Dark energy has a great influence on the universe, since it is 70% of all energy and because it uniformly occupies interstellar space. If the substance is negative pressure then its effect is a gravitational repulsion.

In the coming years it will be possible to identify dark energy and understand its field equations. This limitless energy, omnipresent in the universe, can power Alcubierre's engine and make this super technology accessible.

20-HUMAN-X TECHNOLOGIES is the 3rd generation body-worn microportable PC at a biodigital peripheral level. It is the product of the convergence of three existing advanced technologies: 1) Google Glass - Hololens, 2) BCI (Brain Computer Interfaces), 3) Synthetic Digital Telepathy. The result is a cranial, lens-like device that allows mental commands over microchip processing, supporting virtually unlimited applications and functions.

Due to the fact that during its use the brain is neurostimulated to enter the alpha wave frequency and greater coherence between both hemispheres, the subject experiences an increase in their average IQ and an intensification of their concentration and memory capacity. Likewise, the device replaces the cell phone. The systematic and constant processes of miniaturization of the hardware components, especially in the case of chips and HD, or rigid memory, decreasing the sizes and increasing the storage and processing capacity of data; now make this 3rd technological

revolution possible. Through Human-X it will be possible to control the functions of the home, car and work, ordering everything with mental commands.

In its most advanced phase, the device supports the remote control of the quantum energy tides of the entire solar system.

We are trying the link, the physical connection between the silicon chip, for the moment, and the neurons, the dendrites and the axons. The idea is interconnection. We have made some significant progress through several converging paths. It has even been experimented with the biological reaction of the neuron with the connection terminals of the chips. In some experiments it has been seen that neurons integrate with them. Somehow they are sensitive to structures capable of processing and storing information. They keep an intrinsic similarity and tend to communicate, establish interconnection bridges, naturally. In other words, neurons react.

Another concept of neurodigital interconnectivity is through electroencephalographic sensors attached externally to the skull to transmit EEG waves captured and interpreted by the microprocessor, in what is called Synthetic Digital Telepathy. It is a more advanced, less invasive principle.

The idea of the final previous paragraph is still more advanced. He says that if we can understand the invisible interconnection pathways between two or more brains, which we interpret as telepathic links, brain processing can supplant microprocessor processing. Why? Because the brain is also a quantum super-processor complex and not just neural in 3rd D. Also in 4th D.

At this quantum level, brain intelligence can process potentially infinite loads of data on a multidimensional scale. This is the starting hypothesis or thesis. If this is so, then it is not necessary to use the chip as an auxiliary or supplementary data processing bridge, it is directly possible to replace the chip with all networked human brains.

To understand the idea a little more: A computer in its architecture dialogues with its peripherals and feeds back its inputs through them. An external action-reaction loop is established-internal-external or vice versa. Now, the concept that we are analyzing predicts that we can interconnect all the digital peripherals directly to the human brain and this, without the help of a microprocessor, can process all the data.

Is this impossible? Theoretically no. If the brain is a machine for processing data and it does so at different speeds or frequencies, it may have a higher level of processing than imagined. What is the key factor for this transcendental technology? Better understand the essence of the mind, its structure.

Observe that the mind is an integral process, that it is not splittable. When we say there is information in a library, on the internet, in the very structure

of matter, we think that this accumulated knowledge is outside of ourselves.

We do not reflect that outside is inside of our own internal mental essence. And that the human brain has the naturally developed capacity to establish the correct interconnections that allow this direct perception. That is, the input and the enter. Again: fascinating.

Light Orifice, Human-X's operating system, is capable of co-processing at the pure quantum level and directly dialogue with the Cosmic Quantum Mind or Pure Quantum Information. In the light of the thesis that is presented here, the microprocessor of this new operating system is ourselves, all our human brains interconnected in a network.

However, this level of new knowledge requires assistance from NASA's top-level scientific staff and working cooperatively with corporations the likes of Microsoft. Together with the healthy action of modifying the global socioeconomic and political system. If we don't do this in parallel, we fall into a trap, into a dead end of our future evolution.

Why? Because it is total power and if it falls into few hands, it will be the end of human freedom. It must be able to be freely used by everyone. And, to achieve this objective, our life system must first change direction.

The Total Power that Transcendental Technology (TT) allows, does not allow access to the condition of the human creature in its current phase of evolution, that is to say, of slave social organization. The irrational logic of the order subjected to the benefit of accumulating money, in a few hands, is a level much lower than that required for the correct use of TT.

Humanity must choose to change positively. If you do not, you will not be allowed access to this higher knowledge. From the point of view of God Consciousness, Cosmic Unified Consciousness or Higher Intelligence more evolved in some part of the immense cosmos, a destructive species such as humans must not reach such power and this must be avoided at any cost, including complete destruction. of said race and its world.

These concepts related to TT do not appear spontaneously, they are correlated with the latest advances in science and technology. The human being is invading Sacred Territory and has attracted the attention of the presence of a non-human, extraterrestrial or divine Higher Intelligence if you will, for that matter.

The human being and his civilization grew inside a bubble, coinciding with the border of the solar system that Planet Earth occupies, his receptacle. Such a bubble allowed for differential causal laws, an exception on a cosmic scale. A toning down of Law of Karma. This allowed for greater choice and greater complexity in neurocerebral development. This bubble broke and the Law conditions in the entire cosmos now begin to modify the reaction returns in the terrestrial field of existence and reality.

New external conditions have appeared that force a greater correct internal adaptation. And opening the door to time travel and experimenting with the Higgs boson forced a careful observation about the potential of human nature for equilibrium or its collective inability to achieve it.

By themselves, all human beings and living beings are time travelers, and jump from one moment of relative existence to another, going through waves of absolute existence, but they do so within constant sequential coordinates, which is why they interpret the phenomenon as natural.

Starting from the step of the ordinary waking consciousness of the human being, the structuring order is rearranged through interactions regulated by principles adjusted to increasing scales. Field theory, supersymmetries, Einsteinian relativity, allow new relationships with the dynamics of time, superstrings, and multidimensional wormholes.

That is to say, life grows from a simple structure towards the total complexity possible, according to a previously given external order and with which it constantly interacts, adapts and adapts it; that is, it returns the adjustment and mutation pressure. How do you return it? the human being fully developed it is capable of interacting with time. This concept is more advanced than simple translation or time travel. If human thought manages to connect with the temporal strings, it can interact with the totality of its flows. I eat? Through intelligent quantum computing.

What is the substance of the mind? Consciousness and this is pure thought, which is transformed into matter in order to manifest itself as intelligence. And what is the law of thought? Constancy, that is, inertia or concentration. All thought exists insofar as it is probable that it exists, and because it is, it can be sustained.

What else do you need? A physiology of pure quantum inertia. I eat? Through the temporal cords. It is not space that is rolled up and twisted, it is time. The dimensionality of space exists, in terms of time. This is so because of the property of reversibility and not of irreversibility of time. This condition of reversibility, of indefinite mutation, is what allows the emergence of spatial coordinates.

Therefore, the Big Bang is a phenomenon of time expansion and not space expansion. What evolves retrogradatively is time and not space. What then is time? The high-frequency excitation of imaginary waves of pure quantum particles, self-contained by the vacuum singularity prior to the first expansion, pre-Big Bang.

The human brain, somewhere in its evolutionary path, transferred the simple perceptual computation of action-reaction to a higher dimension. At this level, he developed software where the self is projected and coexists in parallel. Its activity contributes to the formation of the ordinary waking state of consciousness, it can be said that the final perceptual state, the final adjustment that the human brain makes to perceive and interpret the reality

of the external world, is a result of processing in this reality or virtual, internal neurocerebral plane.

The parallel processing capacity, within a virtual reality environment, explains the dynamics of dreams. When the human subject sleeps, what happens is that the ordinary waking level of consciousness is disconnected and the focus of attention descends to an immediately lower level, that of the internal mental software, its virtualized reality processing field.

By interrupting the connection with the flow of perceptual motor information, which turns on the layer of external consciousness, in contact with material reality, the conscious submerges towards its own internal layers and energy consumption is saved, which is reused in completing repair and completion functions of higher levels of mnemonic processing. In other words, the higher processing functions require more energy.

When we really think, that is, the mind goes deeper into the data, compares and synthesizes, is when we find ourselves in the zone of our virtualized internal reality.

This virtualized reality is the nexus for functions and operations above the levels of ordinary material perception. If the telepathic flow exists, such language is decoded at the level of virtual reality, below the externalized conscious. Yogi concentration and meditation manages to penetrate this layer and control it consciously, hence its amplified perceptions, because in internal virtual reality, there are no objective or material limitations.

The same relationship or jump occurs between the reality field of the hardware and the software. Furthermore, within this area of the conscious or brain processing sublayers, there is the potential for telepathic brain networking. And being a virtual universe, it is at this level where parallel worlds exist.

REMOTE CONTROL OF THE SOLAR FIELD, it is possible through Human-x phase IV to exercise remote control over the tides of quantum energy exchanges, gravitons, neutrinos, neutrons, photons and time and space fluctuations of the entire solar system, coupling synthetic digital telepathy software and virtual reality internal cerebral quantum computing system, with the satellite hardware installed and emitting electromagnetic pulses and precise quantum oscillations, in order to mentally or cerebral control all the exchange tides between matter and energy of the solar complex of our stellar system. This super technology can eventually be used as a defensive weapon in the event of a hostile alien intrusion towards Earth.

AIH (Artificial Intelligence Human), Human-X supports an interface through its synthetic digital telepathy system to splice the brain's synaptic circuitry directly with AI processing and data. Human-X is a non-invasive multi-use 3rd generation cranial device.

21-SUPER NANOTECHNOLOGY. The MPTM, acronym in English for Magnetoactive Phase Transition Material. It is made of a metal that melts near room temperature, it can go from a solid to a liquid. It is approximately five millimeters wide and one centimeter high.

Magnetoactive phase transition matter is made of neodymium-iron-boron magnetic microparticles embedded within a gallium matrix. It heats up and undergoes a phase change from solid to liquid when exposed to an alternating magnetic field, and resolidifies when cooled.

A magnetic field at a certain intensity induces an electric current inside the gallium that generates heat, turning it from a solid to a liquid.

A nanorobot is a machine that can build and manipulate objects at the atomic level. A red blood cell has a diameter between 7 and 8,000 nanometers.

In a natural way, the human being has intracellular nanorobots such as the ribosome, which read the RNA and create a specific protein. It differs from Drexler's wet, biological nanotechnology that assembles in a similar way to a 3D printer by printing atoms at the nanoscale and creating stable thermodynamic structures.

A nanomotor has been created from a single atom trapped in a cone of electromagnetic energy and lasers are used to heat and cool it, causing the atom to move back and forth like a piston in a machine.

Through DNA Origami it is already possible to manufacture complex mechanical parts of future nanorobots at the nanoscale. It has also been possible to equip medical nanorobots with the ability to swim to reach cancer cells in the bloodstream and discharge medicines into them.

There are already nanomotors with a force 100 times greater than their weight. Which allows nanorobots to penetrate cells and fight disease. Prototypes that feed on bacteria and can direct the growth of stem cells or build microstructures have also been achieved.

The new applications are unlimited. Like nanorockets, combining nanoparticles with biological molecules, to go anywhere in the body and deliver drugs. Detection and elimination of cancer cells. Internal administration of drugs. Nano particles to facilitate image detection. Omni-detection of internal and external environments.

Increased data storage capacity per gram of DNA, more than 700 terabytes. Effective energy saving in renewable energy systems. New generation of super resistant materials to be used in terrestrial and space engineering and architecture works.

Glasses that clean themselves and darken on their own, adjusting the light and temperature of the interior environments. Microsponges to clean the oceans. Molecular replicators or assemblers, which regulate chemical

reactions to assemble reactive molecules with atomic precision. Multipurpose health sensors. Interconnectivity of brains with the Internet.

This is the present and tomorrow, the day after tomorrow it will be possible to reach metaform replicating supernanotechnology. This new generation of nanorobots that may be mechanical or biochemical extract the replication elements from the existing nutrients in the environment and ipso facto replicate in a similar way to the process of cell mitosis.

They have a collective intelligence and software that controls and directs them. Joining and assembling with each other they can take any form such as tools, houses and vehicles. Human beings who interact with this artificial nanotechnological life form can command changes, for example, they can order furniture to transform into others or their vehicles to change shape.

Another vital use of intelligent nanorobots is to interact with the environment, being able to decontaminate ecosystems and terraform entire exoplanets in short periods of time.

22-EUGENICS. Through advanced biodigital neurotechnology, the balance can be restored in the vital energy that circulates through the spinal cord. Thus it is possible to reverse the effect of the wear produced on this current, adding extra energy and thus correcting the defect.

While it is true that there is a chemical process involved in the aging or wear and tear of the physical body, the phenomenon occurs before at the micro-electronic, bio-electromagnetic level.

The field of human vital energy makes a journey during the period of waking consciousness, after which the trace of wear is left. The technique intervenes and makes it possible to erase this trace, so that the body avoids the effect of aging. This implies that wear is not constant, it is cyclical and can be reversed.

In this way, it is possible to stop the biological clock, stop cell aging and even cause tissue regeneration and rejuvenate the physical body without altering the subject's brain memory.

Once this super technology is achieved, it is possible to reverse all diseases and achieve the perfect body, through intelligent molecular genetic and DNA self-control.

Likewise, through neurogenesis it is also possible to increase the number of active neurons in each human brain, multiply the synapses and increase the average IQ through an appropriate training system.

The greatest scourge that punishes the human species is its low IQ, which is between 90 to 100 average points. Every effort should be made so that the population average floats between 140 to 220 points. This is possible using advanced technology, designing proactive and positive urban

environments and through a proper constant psychophysical training system.

- 23- Microwindows. History of search engines: 1-Yahoo. 2-Google. 3 – Microwindows. Thinking that everything is done on the Internet is a repeated mistake. First Yahoo appeared by ordering a directory of links to access other websites. Second came Google with search engines to do this very thing. Thirdly, MicroWindows now appears, synthesizing the two previous experiences in a single version. MicroWindows is a MultiWeb system with an internal-external search engine applied to international e-commerce and e-business.
- 24- 7 Master Portals containing millions of pages reprocessed for e-commerce and intensive, global and massive e-business, applying the Toyota assembly system.
- 25- Interassociated virtual real estate system allowing international online purchases, sales and auctions.
- 26- GSL E-learning online university and tertiary courses.
- 27- GSL E-books, paid electronic books for download online.
- 28- Midas Solidarity Lottery online, donate 50% of the profit.
- 29- Green Card, credit card that donates 50% of the net profit obtained to the global tree planting program.
- 30- Franchising, expansion of the system by assigning a percentage of the profits of GSL Systems.
- 31- Affiliation, international recruitment of account executives through personalized online sales websites with their own subdomain.
